# REVISION HISTORY

Revision Date	Revised Pages	Serial Number Effectivity	Comments
07/15/04	All		First issue of manual and replacement parts
08/31/04	7		Revised operation procedure.
08/31/04	12		Revised the pump timer operation sequence.
08/31/04	13		Revised the float switch information.
8/31/04	14		Revised the terminal connections drawings and inserted figure number for electric booster.
8/31/04	18		Added drive motor wiring drawings and information.
09/01/04	20		Part number 328473 replaced by 328977. Added 36" Prewash panels.
9/01/04	20, 23, 25	R3448	Added new door catch components.
9/01/04	23		Part number 327890 replaced by 328974. Added entrance and exit curtain baffles.
9/01/04	25		Part number 327891 replaced by 328975. Added E84 front panels.
9/01/04	31		Part number 328799 replaced by 328450. Added new cradle bracket for two tank machines.
9/01/04	37		Updated part numbers for scrap screens and refuse baskets.
9/01/04	61, 63		Updated part numbers for drain levers and overflow rod.
9/01/04	64, 66		Corrected piping drawings.
9/01/04	73		Changed part number 113727 discharge hose to 112807.
12/16/04	51, 53, 77		Added 575 volt elements and corrected part number for 10KW element.
2/16/05	91		Added revised schematics.
5/16/05	91		Added revised schematics.

# LIMITED WARRANTY

Champion Industries Inc. (herein referred to as Champion), P.O. Box 4149, Winston-Salem, North Carolina 27115, and P.O. Box 301, 2674 N. Service Road, Jordan Station, Canada, L0R 1S0, warrants machines, and parts, as set out below.

**Warranty of Machines:** Champion warrants all new machines of its manufacture bearing the name

"Champion" and installed within the United States and Canada to be free from defects in material and workmanship for a period of one (1) year after the date of installation or fifteen (15) months after the date of shipment by Champion, whichever occurs first. [See below for special provisions relating to glasswashers.] The warranty registration card must be returned to Champion within ten (10) days after installation. If warranty card is not returned to Champion within such period, the warranty will expire after one year from the date of shipment.

Champion will not assume any responsibility for extra costs for installation in any area where there are jurisdictional problems with local trades or unions.

If a defect in workmanship or material is found to exist within the warranty period, Champion, at its election, will either repair or replace the defective machine or accept return of the machine for full credit; provided, however, as to glasswashers, Champion's obligation with respect to labor associated with any repairs shall end (a) 120 days after shipment, or (b) 90 days after installation, whichever occurs first. In the event that Champion elects to repair, the labor and work to be performed in connection with the warranty shall be done during regular working hours by a Champion authorized service technician. Defective parts become the property of Champion. Use of replacement parts not authorized by Champion will relieve Champion of all further liability in connection with its warranty. In no event will Champion's warranty obligation exceed Champion's charge for the machine. The following are not covered by Champion's warranty:

- a. Lighting of gas pilots or burners.
- b. Cleaning of gas lines.
- c. Replacement of fuses or resetting of overload breakers.
- d. Adjustment of thermostats.
- e. Adjustment of clutches.
- f. Opening or closing of utility supply valves or switching of electrical supply current.
- g. Cleaning of valves, strainers, screens, nozzles, or spray pipes.
- h. Performance of regular maintenance and cleaning as outlined in operator's guide.
- i. Damages resulting from water conditions, accidents, alterations, improper use, abuse, tampering, improper installation, or failure to follow maintenance and operation procedures.
- j. Wear on Pulper cutter blocks, pulse vanes, and auger brush.

*Examples of the defects not covered by warranty include, but are not limited to:* (1) Damage to the exterior or interior finish as a result of the above, (2) Use with utility service other than that designated on the rating plate, (3) Improper connection to utility service, (4) Inadequate or excessive water pressure, (5) Corrosion from chemicals dispensed in excess of recommended concentrations, (6) Failure of electrical components due to connection of chemical dispensing equipment installed by others, (7) Leaks or damage resulting from such leaks caused by the installer, including those at machine table connections or by connection of chemical dispensing equipment installed by others, (8) Failure to comply with local building codes, (9) Damage caused by labor dispute.

**Warranty of Parts:** Champion warrants all new machine parts produced or authorized by Champion to be free from defects in material and workmanship for a period of 90 days from date of invoice. If any defect in material and workmanship is found to exist within the warranty period Champion will replace the defective part without charge.

**DISCLAIMER OF WARRANTIES AND LIMITATIONS OF LIABILITY. CHAMPION'S WARRANTY IS ONLY TO THE EXTENT REFLECTED ABOVE. CHAMPION MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED, TO ANY WARRANTY OF MERCHANTABILITY, OR FITNESS OF PURPOSE. CHAMPION SHALL NOT BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES. THE REMEDIES SET OUT ABOVE ARE THE EXCLUSIVE REMEDIES FOR ANY DEFECTS FOUND TO EXIST IN CHAMPION DISHWASHING MACHINES AND CHAMPION PARTS, AND ALL OTHER REMEDIES ARE EXCLUDED, INCLUDING ANY LIABILITY FOR INCIDENTALS OR CONSEQUENTIAL DAMAGES.**

Champion does not authorize any other person, including persons who deal in Champion dishwashing machines to change this warranty or create any other obligation in connection with Champion Dishwashing Machines.

# SAFETY SUMMARY

## Safety Symbols

- The following symbols appear throughout this manual alerting you to potential hazards. Statements associated with each symbol are printed on *italics*.

### WARNING:

Warning statements indicate any condition or practice that could result in personal injury or possible loss of life.

### CAUTION:

Caution statements indicate any condition or practice which, if not strictly observed or remedied, could result in damage to or destruction of the dishwasher.

### NOTE:

Note statements indicate any condition or practice which, if observed, will help in the safe completion of a task.

## General Safety Rules

- The following general safety rules must be observed in addition to the specific cautions and warnings presented in this manual.
- Your Champion pot and pan washer uses hot water to clean and sanitize a variety of wares. Machine surfaces and wares become hot during and immediately following normal operations. Operators should use caution when loading and unloading wares from the machine.
- Operators must NOT bypass a safety interlock or control(s) to operate unit.
- The service and maintenance instructions contained in this manual are intended for qualified service personnel. These instructions assume that you are trained in basic electricity and mechanical theory. If you are not a trained technician, then do not attempt to adjust or repair the dishwasher as serious personal injury or damage to the dishwasher may result.

# INTRODUCTION

Welcome to **Champion**....

and thank you for allowing us to take care of your dishwashing needs.

This manual covers several models. Model numbers are shown on the front cover.

Your machine has been completely assembled, inspected, and thoroughly tested at our factory before it was shipped to your installation site.

This manual contains:

- Warranty information
- Operation and cleaning instructions
- Maintenance instructions
- Troubleshooting guide
- Basic service information
- Replacement parts lists
- Electrical schematics

Complete and return your warranty registration card within ten (10) days after the installation of your machine.

All information, illustrations and specifications contained in this manual are based upon the latest product information available at the time of publication. **Champion** constantly improves its products and reserves the right to make changes at any time or to change specifications or design without notice and without incurring obligation.

For your protection, factory authorized parts should always be used for repairs.

Replacement parts may be ordered from your **Champion** authorized service agency. When ordering parts, please supply the model number, serial number, voltage and phase of your machine, the part number, part description, and quantity.

## **GENERAL**

This manual covers the Champion single tank and two tank rack conveyor dishwashing machines. These machines are fully automatic and are equipped with 1 HP prewash and 2HP wash and rinse pump motors (depending on the model) and a 1/6 HP conveyor drive motor. All models are available for a right-to-left or left-to-right operation.

These series of dishwashers are modular in design. The following models and options are covered in this manual:

### **Model Numbers**

Single Tank - Basic.....	44, 54, 44 WS, 44 LT
Single Tank with 22" Prewash.....	66 PW, 76 PW, 66 WS, 66 LT PW
Single Tank with 36" Prewash.....	80 HDPW, 90 HDPW, 80WS HDPW
Single Tank with 26" Front Feed Prewash.....	70 FFPW, 80 FFPW, 70 WS FFPW

- The 44 and 54 basic models along with their respective prewash options, are high temperature (180°F/80°C final rinse) sanitizing models.
- The 44 WS models along with their respective prewash options, are water and energy saving, high temperature (180°F/80°C final rinse) sanitizing models.
- The 44 LT model, along with its respective prewash option, is a low temperature (140°F/60°C final rinse), chemical sanitizing model for use with sodium hypochlorite solution (chlorine bleach) as the sanitizing agent.

Two Tank - Basic.....	64, 72, 84
Two Tank with 22" Prewash.....	86 PW, 94 PW, 106 PW
Two Tank with 36" Prewash.....	100 HDPW, 108 HDPW, 120 HDPW
Two Tank with 26" Front Feed Prewash.....	90 FFPW, 98 FFPW, 110 FFPW

- The 64, 72 and 84 basic models, along with their respective prewash options, are high temperature (180°F/80°C final rinse) sanitizing models.

# INSTALLATION

## Unpacking

### CAUTION:

*Care should be taken when lifting the machine to avoid damaging the piping under the base. Remove the dishwasher front panels and lift from the front with a forklift.*

1. Immediately after unpacking your machine, inspect for any shipping damage. If damage is found, save the packing material and contact the carrier immediately.
2. Remove the dishwasher from the skids. Adjust the feet if required, then move the machine to its permanent location. The machine should not be installed within 6 inches [153mm] of any wall or structure.
3. Level the machine by placing a level on top of the machine and adjust the feet. Level the machine by unscrewing the feet from the base. Adjust from the front-to-back and side-to-side.

## Plumbing Connections

### CAUTION:

*Plumbing connections must comply with local sanitary and plumbing codes.*

1. Connect the hot water supply at the final rinse piping connection located behind the control cabinet at the top of the machine.
2. A "Y" strainer is provided by Champion for machines without booster. A pressure reducing valve (PRV) is provided by Champion for machines with built-in boosters.
3. If the incoming hot water supply pressure exceeds 25psi [173kPa] at machine, a PRV must be installed and set to 20-22psi [138-151 kPa]. The PRV may be purchased from Champion or supplied by others.
4. Install a manual shut-off valve in the steam and water supply lines to accommodate servicing the machine. The valve should be the same size as/or larger than the supply line.
5. Provide suitable gravity drain to connect to a 1-1/2" NPT drain pipe.

## INSTALLATION (CONT.)

### Electrical Connections

 **NOTE:**

*Electrical and grounding connections must comply with the National Electrical Code and/or Local Electrical Codes.*

**WARNING:**

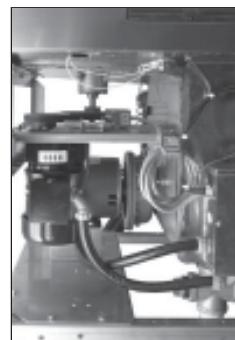

*When working on the dishwasher, disconnect the electric service and tag it to indicate work is being done on that circuit.*

 **NOTE:**

***Electric boosters require a separate electrical connection (except the 44WS and 66 WS PW models that have a single point connection).***

*A fused disconnect switch or circuit breaker (supplied by user) is required to protect each power supply circuit.*

1. Compare the electrical specifications on the machine electrical connection plate (located inside the control cabinet) to the electrical power supply before connecting to the incoming service at a fused disconnect switch.
2. Motor rotation is set at the factory. Ensure proper rotation of the conveyor drive shaft (red arrow on side of motor shows direction of rotation). Single phase drive motor (208-240V only) rotation must be changed at the drive motor junction box. Three phase drive motor (480-575V) rotation must be reversed in the control cabinet. Reversing the pump motor(s) direction is done in the control cabinet by reversing the wires L1 and L2 on the disconnect switch side of the main electrical connection terminal block (refer to the electrical diagrams in the back of this manual).
3. A knock-out plug is provided at the rear of the control cabinet for electrical service connections.

**Figure 1- Motor Rotation**

### Ventilation

**CAUTION:**

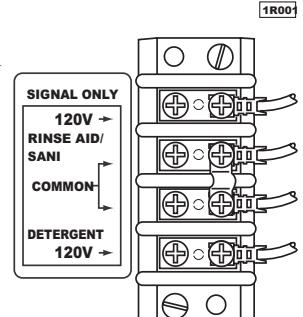

*Exhaust air should never be vented into a wall, ceiling, or concealed space if a building as condensation will cause damage.*

1. Stainless steel watertight ducting should be installed **INSIDE** the 4" x 16" [102mm x 407mm] vent stacks at the load and unload ends. A minimum of 6 air changes per hour of kitchen air is recommended. The typical exhaust ventilation requirements for a rack machine using a 180°F/82°C final rinse are:
  - The load end requires 150 CFM @ 1/4" (SP), [71 Liters/Sec] with prewash.
  - The load end requires 200 CFM @ 1/4" (SP), [95 Liters/Sec] without prewash.
  - The unload end requires 400 CFM @ 1/4" (SP), [189 Liters/Sec].
2. An adjustable damper is supplied with the optional vent stacks for regulating the exhaust volume.

## INSTALLATION (CONT.)

### Chemical Connections

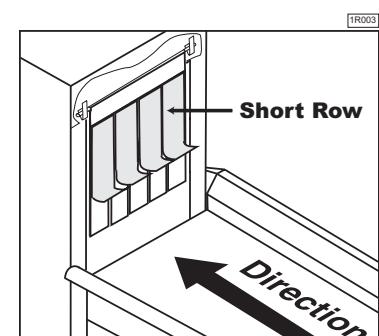

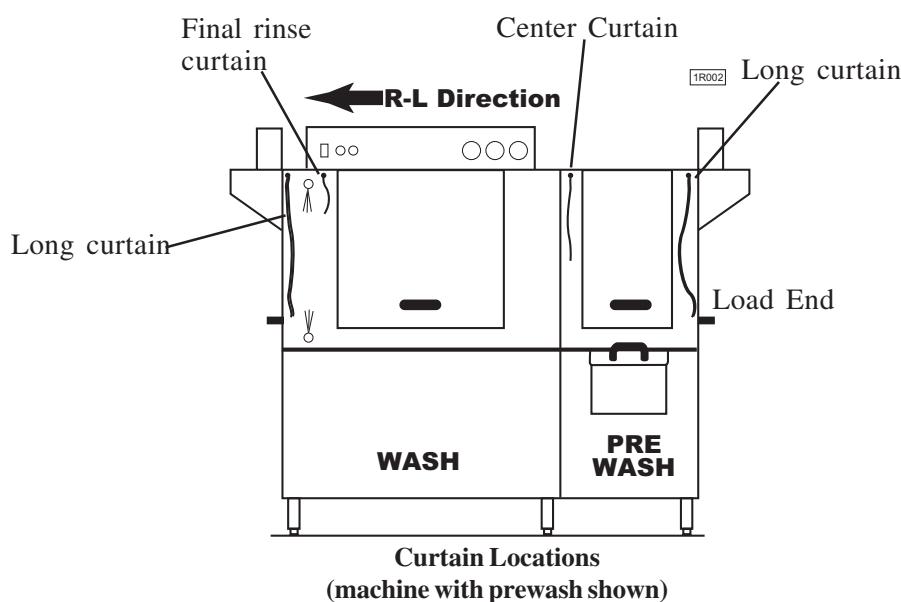

1. Use a qualified detergent/chemical supplier for detergent/chemical and dispensing equipment needs.
2. Labeled detergent control circuit connection terminals are provided in the control cabinet for detergent and rinse agent/sanitizer dispensing equipment (supplied by others).
3. The illustration on the right, shows the terminal board for the current production machines . The signal connection points include:
  - Detergent signal 120VAC, 1Amp max amp load
  - Rinse aid/Sanitizer signal 120VAC, 1Amp max amp load
4. A removable black plug is provided in the load end side of the wash tank (behind the drive motor) for installation of the detergent conductivity cell.

Chemical Connection Terminal Board

### Curtain Locations

1. Refer to the illustrations below and hang the curtains as shown.  
J-hooks are located in the corners of each section to accept the curtain rods.
2. Make sure the that the short flaps of the curtains face the load end of the dishwasher.  
The longest curtains always go on each end of the dishwasher.

Short row of curtains face out to the load end (or unload depending the location of the curtain) of the dishwasher.

## INSTALLATION (CONT')

### Completing Installation

#### WARNING:

*Do not insert racks into the machine before the tanks fill with water and have reached the proper temperatures. Operating the pumps dry will cause pump seal damage and leakage that can result in a motor failure.*

1. Remove any foreign material from inside of the machine.
2. Check to insure that the drains/overflow pipes are operational and sealed.
3. Position scrap screens on the supports above the tanks.
4. After all plumbing and electrical connections are completed, fill the tank and wait 10 minutes.  
Check all plumbing connections for leaks.
5. Drain the tank and check the drain lines for leaks.
6. The formed down lip of the dishtable should be placed inside of the machine. The dishtable should be pitched toward the dishwasher for proper draining by adjusting its leveling feet. The dishtable should be sealed to the dishwasher.

## OPERATION

Follow the procedure below to operate your dishwasher properly.

1. Verify that the spray pipes, curtains, and scrap screens are in place and clean.
2. Verify that the overflow drains are closed.
3. Turn on the detergent dispenser switches and check the detergent supply.
4. Turn on the exhaust vent system (if applicable), and make sure it is operating.
5. Close the door(s). Push the power switch ON, light will illuminate. Machine will begin to fill (with or without a booster, machine fills thru the fill valve and through the final rinse).
6. When the tanks are full, wait until the wash tank has reached the proper temperature. Check the wash tank temperature gauges located on the control cabinet. Minimum wash temperatures are:
  - 44 LT, 66 LT PW - **140°F/60°C**
  - 44, 54, 44 WS - **150°F/66°C**
  - 66 PW, 76 PW, 66 WS PW - **160°F/71°C**
7. Press the Green Lighted **START** Pushbutton on the control cabinet. This will activate the automatic operation for the drive motor and the pumps. The green light will come on. No other noticeable action will happen until the first rack is loaded into the machine.
8. Scrap and pre-flush all items to be placed and load items into racks.

### **NOTE:**

**DO NOT OVERLOAD RACKS.**

- Pegged racks are for plates and/or trays. Flat racks are for bowls and/or silverware. Spread silverware evenly in a single layer in a flat rack or upright (loosely packed) in a cutlery rack/cylinder.
9. Push the rack into the machine, the conveyor and drive system will grab the rack and pull it into the machine. The rack start lever (idle pump switch) will start the pumps and the system will run a cycle for 90 seconds. When another rack is inserted it resets the pumps for another 90 second cycle.
  10. Check the final rinse pressure and temperature as the racks pass through the final rinse. This final rinse pressure **MUST** be 20-22 psi [138-151 kPa] and the final rinse temperature **MUST** be a minimum of 180°F/82°C .
  11. The pumps and the conveyor drive will automatically stop after the last rack leaves the machine and the 90 second cycle time has completed.
  12. The machine may be stopped at any time during the cycle by pressing the red **STOP** pushbutton on the control cabinet. The green light will go off on the green **START** pushbutton, the power is removed from the idle pump circuit but the heaters and fill remain on. To restart, push the green **START** pushbutton to reset the automatic cycle. Insert another loaded rack to start the idle pump switches. When the rack that was inside of machine has exited, reinsert that rack back into machine to make sure that the complete sanitation cycle of the original rack has been completed.

### OPERATION (CONT')

13. The machine may also be stopped at any time during the cycle if the door(s) are raised. When the door is raised the light on the green **START** pushbutton goes off. The power is removed from the idle pump switch and the heat circuit. To reset the unit, close the door(s) follow the same procedure as in step 12. Push the green **START** pushbutton to reset the automatic cycle. Insert another loaded rack to start the idle pump switches. When the rack that was inside of machine has exited, reinsert that rack back into machine to make sure that the complete sanitation cycle of the original rack has been completed.
14. CLEAN the scrap screens and scrap baskets (if necessary) and REPLACE the tank water after each meal period or every 2 hours of operation. Check the chemical supply.

#### **CAUTION:**

*DO NOT allow racks to remain on unload dishtable. This could cause the conveyor to jam and may damage the machine. The installation of a table limit switch is highly recommended and will reduce the risk of damage.*

#### **CAUTION:**

*DO NOT leave water in the tanks over night.*

# MAINTENANCE

The efficiency and life of your machine is increased by regularly scheduled preventive maintenance. A well maintained machine gives better results and service.

The best maintenance you can provide is to keep your machine clean. Components that are not regularly cleaned and flushed will clog and become inoperative.

Intervals shown in the following schedules represent an average length of time between necessary maintenance. Maintenance intervals should be shortened whenever your machine is faced with abnormal working conditions, hard water, or multiple shift operations.

## Maintenance Schedule

### Cleaning

- **Daily/Every 2 Hours of Operation**

1. Turn power switch to **OFF**.
2. Pull drain lever(s) to drain water. Remove scrap screens and scrap baskets (internal and external ,if applicable). Clean inside of the tanks and flush with clean water. Back flush the scrap screens until clean. (See Figs 2 & 3)

**Figure 2-**  
**Scrap Screen Removal**

**Figure 3-**  
**Scrap Basket Removal**

#### **NOTE:**

*DO NOT strike or bang screens or baskets against solid objects*

3. Remove the spray pipes (Figs. 4-6) Remove the end cap from each spray pipe (Fig. 7). Flush the pipes and nozzles until clean.

**Figure 4-**  
**Unhooking Upper Arm**

**Figure 5-**  
**Upper Wash Arm Removal**

#### **NOTE:**

*DO NOT strike or bang wash pipes against solid objects*

Replace the end caps and verify the rubber o-rings are in place. Reinstall the spray pipes.

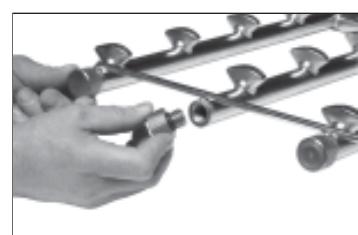

4. Remove and clean the curtains. Hang them off the dishtable and allow them to dry at the end of the day.
5. Leave the doors open between operations, allowing the machine to dry.
6. Verify that the final rinse nozzles are clean and free of any internal hard water deposits. If necessary, clean the nozzle orifices with a small paper clip. Consult your chemical supplier for proper use and the kind of deliming chemicals needed.
7. Report any unusual conditions to your supervisor.

**Figure 6-**  
**Lower Wash Arm Removal**

- **As Required**

1. Check the temperature and pressure gauge readings
2. Inspect the machine and check the pump motor for any leaks around the shaft
3. Check the chemical supplies and refill as necessary.

**Figure 7-**  
**End Cap Removal**

## MAINTENANCE (CONT')

- **Weekly**

1. Inspect all water lines for leaks and tighten at joints if required.
2. Clean all of the detergent residue from the exterior of the machine.
3. Check the drain/overflow tube for any leaks,
4. Clean the accumulated scale from the heating element.
5. Remove and closely inspect each spray arm for blockage.
6. Straighten a small paper clip to clear each final rinse nozzle.
7. Inspect the pawl bar and drive assembly for wear and freedom of travel.
8. Check the float switch(es) in the tank(s) for freedom of travel.
9. Check the idle pump(s) and final rinse lever for freedom of travel.

### Deliming

Your dishwasher should be delimed regularly as required. This will depend on the mineral content of your water.

Inspect your machines interior for lime deposits. If required, consult your chemical supplier for the proper type and procedures on deliming agents.

If you have a chemical sanitizing model 44 LT or 66 LT PW, **CAREFULLY** follow the procedure below before deliming:

#### DANGER:

*Deliming solution, rinse agents or other acids must not come in contact with household bleach (sodium hypochlorite) or any chemicals containing chlorine, iodine, bromine, or fluorine. Mixing may cause hazardous gases to form. Consult your chemical supplier.*

1. Remove the suction tube assembly from the bleach container and place it as close as possible to the floor. Place a catch pan underneath it.
2. Cycle the machine approximately six times to purge the lines of the bleach.
3. Proceed with the deliming procedures.

# ELECTRICAL SERVICE

## Fuse Blocks - 120VAC Control Voltage

Two fuse blocks, located in the center of the front of the main control cabinet, protect the main control transformer. Each fuse block holds one fuse. The fuses are marked 1FU and 2FU on the electrical schematic.

To replace the fuse:

- Disconnect the power to the machine at the main service switch.
- Remove the fuse and replace it.
- Turn the main power on.
- If the fuse blows again, DO NOT INCREASE THE FUSE SIZE.
- DETERMINE THE CAUSE OF THE OVERLOAD.

Fig. 5 shows the fuses and fuse blocks.

**Figure 8-**  
**Fuse Blocks**

## Motor Overloads

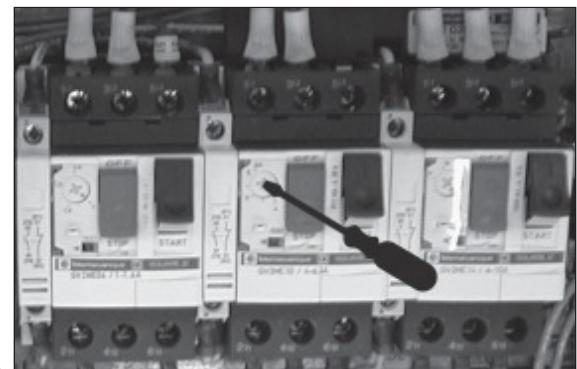

Motor overloads are located to the left of the fuse block inside the control cabinet. Each motor has one overload to protect it from line voltage electrical overloads. In addition, an auxiliary set of switch contacts is attached to the overload. The switch contacts disconnect 120VAC power to the motor contactor coils in the event of an overload condition. Refer to Fig.6.

Note the Switch Lever on the Overload

- If the red OFF switch lever is down with the “OFF” showing then the overload has tripped on an overload.

To Reset the Motor Overload:

- Push the start switch down with “ON” showing.
- Run the dishwasher and test the AMP draw of the motor in question. If the motor checks ok then there may be a wiring problem or the overload may be defective.

**Figure 9-**  
**Motor Overload**

To Replace a Motor Overload:

- Disconnect the wires to the overload.
- Pull forward and lift out.
- Snap the new overload into place and reconnect the wires.

To Adjust the Overload Setting:

The screwdriver in Fig. 6 is positioned to adjust the motor overload AMP setting.

- Read the FLA motor amps that applies for the machine voltage on the Motor Nameplate.
- Flip up the plastic cover. Turn the setting to match the nameplate FLA.

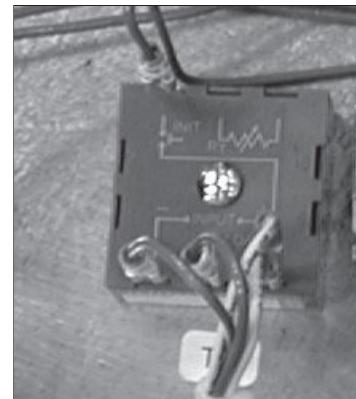

# ELECTRICAL SERVICE (CONT')

## Pump Timer

The automatic timer located in the left center of the control cabinet is preset at the manufacturer.

The Pump Timer controls the amount of time that the pump(s) and the drive motor will run after the last rack enters the load end of the dishwasher tunnel.

The Pump Timer is an OFF DELAY timer. One timer controls all pumps no matter what the model it may be. Cycle time is 90 seconds.

**Figure 10-**  
**Pump Timer**

## To Replace a Timer:

- Disconnect the power to the machine at the main service switch.
- Remove the wires connected to the timer. Remove the screw in the center of the timer.
- Remove the defective timer and install the replacement.
- Reinstall the screw and reinsert the wires.

## Operation Sequence:

- A dishrack entering the machine contacts the idle pump switch lever.
- The contacts of the idle pump switch open, de-energizing control relay 1CR.
- Normally closed contacts of 1CR close and apply a signal to pump timer. The timer contacts close turning on the pump(s) and drive motor.
- The dishrack moves off the idle pump switch lever and the switch contacts close.
- 1CR energizes and the normally closed contacts open removing the signal from the pump timer.
- The pump timer begins to time down for its 90 seconds time setting.
- The timer is reset each time the idle pump switch is activated. If the timer is reset only once it will time out and shut the pump(s) and drive motor off after the time delay.

## To Check the Pump Timer Setting:

### Use a stop watch to check the timing cycle.

- Turn the power on.
- Press the green lighted START pushbutton.
- Place a rack in to the conveyor.
- When the rack enters the load end, the pump(s) and the drive motor will start.
- Start the stop watch when the rack clears the idle pump switch. Stop the stop watch when the machine stops. The length of the cycle should be 90 seconds +/- 2 seconds. If the timer is not within this range replace the timer.

## ELECTRICAL SERVICE (CONT')

### Automatic Fill/Low Water Heat Protection

#### Dual Float Switches

Each tank contains a dual float switch (see Fig.8). The device consists of an angled stem containing two reed switches. Two stainless steel ball floats, containing magnets, slide over the stem and are free to move up and down. When the float moves on the stem, it opens and closes the associated reed switch inside the stem. The reed switches control relays. The relays control the automatic fill and heat for different parts of the machine. The float switch(es) and their relay(s) operate on a 120V circuit.

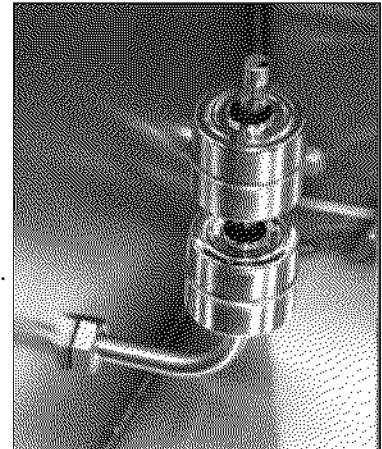

Figure 11-  
Dual Float Switch

#### Circuit Explanation

Refer to the electrical schematic on your machine for a detailed description of the individual float(s), relay(s) and wiring.

#### Bottom Float and Reed Switch

- The bottom float controls the heat.
- When the bottom float is down, the bottom reed switch contacts are open.
- When the bottom float is up, the bottom reed switch contacts are closed.

#### Top Float and Reed Switch

- The top float controls a fill valve, which controls the water level.
- When the top float is down, the top reed switch contacts are open.
- When the top float is up, the top reed switch contacts are closed.

#### Initial Fill

- When the tank is completely empty, both floats are down and their reed switch contacts are open.
- The control relay for the float switch is de-energized.
- The fill valve for the tank is energized and the tank begins to fill with water.
- As the water level in the tank rises, the bottom float begins to move up.
- When the bottom float is completely up, its reed switch contacts close.
- This prepares the heat circuit, but the heat **DOES NOT** energize at this time.
- The tank continues to fill until the top float is completely up.
- The top float's reed switch contacts close. Its control relay energizes.
- The fill valve de-energizes.
- The heat circuit energizes through the contacts of the control relay.

#### During Normal Operation

- If the water level in a tank falls below the level of the top float, the top float moves down and its reed switch contacts open.
- When the water level falls below the level of the bottom float, the bottom float moves down and its reed switch opens.
- The control relay de-energizes. The fill and rinse valve energizes and refills the tank.
- The heat circuit will de-energize until the water level in the tank raises the top float again.
- The bottom float keeps the heat circuit ready as long as the water level is above the level of the bottom float.

## ELECTRICAL SERVICE (CONT')

### Thermostat Locations and Adjustments

**Electric tank heat** is controlled by two thermostats.

1. The control thermostat which regulates the electric tank heat temperature.
2. The high limit thermostat which protects the tank from overheating.

#### Location

Both thermostats are located on the front of the tank, inside of a heater box enclosed in a stainless steel panel, behind the front access panel.

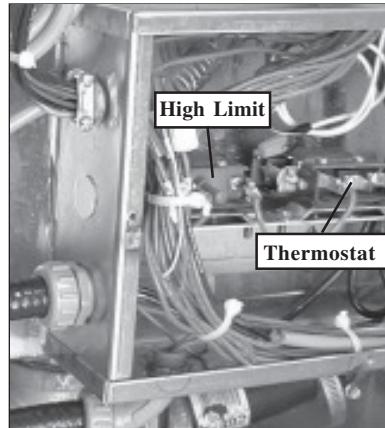

Figure 12-  
Tank Heat Thermostats

#### Adjustment

**The Control Thermostat** has an adjustment screw.

- The thermostat is wire Normally Closed.
- Turn the adjustment screw clockwise to increase the temperature in the tank and counterclockwise to decrease the temperature in the tank.

**The High Limit Thermostat** is not adjustable. It contains a red reset button on its center.

- The red button pops out if the temperature in the tank exceeds 210°F/99°C.
- Press the red button in to reset the high limit.

#### DETERMINE THE CAUSE OF THE HIGH TEMPERATURE CONDITION.

Refer to Fig 13 & Fig 14

**Electric Booster Heat** is controlled by two thermostats.

1. The control thermostat regulates the temperature.
2. The high limit thermostat protects the booster from overheating.
3. Each tank has a control and a high limit thermostat.

#### Location:

**The control thermostat** is in the junction box on the wash tank.

- The thermostat is wire Normally Closed.
- Turn the adjustment screw clockwise to increase the booster tank temperature and counterclockwise to decrease the booster tank temperature.

**The high limit thermostat** is also in the junction box on the wash tank.

- A red button that pops out when the temperature exceeds 210°F/99°C.
- Press the red reset button to reset the high limit.

#### Determine the cause of the high limit temperature condition.

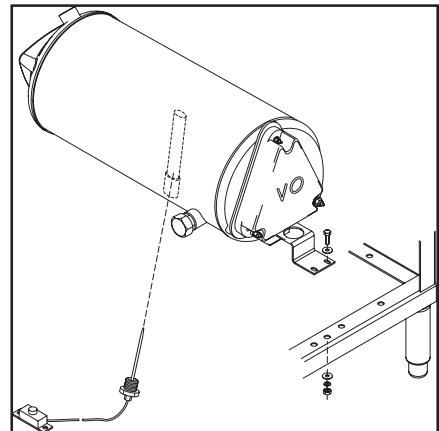

Figure 13-  
Booster Thermostat Location

Booster High Limit Thermostat

## ELECTRICAL SERVICE (CONT')

### Heater Element Wiring-Booster Tank and Wash Tank Heater Elements

Refer to the illustrations and follow the steps below to properly install terminal jumpers and to make line power connections to a replacement element.

**Step 1.** Hold the element assembly with the calrod coils facing toward you.

**Step 2.** Match your element coils to Configuration A or B

**Step 3.** Rotate your element coils to match the correct configuration.

**Step 4.** Flip the element over and match your element to the correct terminal configuration.

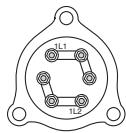

**Step 5.** Install the terminal jumpers according to the illustrations for your voltage requirement.

**Step 6.** Install the element and make your line connections 1L1, 1L2 or 1L3 per the illustration.

**Step 7.** If installing a booster element (that requires the limiting thermostat), the limiting thermostat should be inserted into the center of element. Thermostat should bottom out in the tube approximately 12" deep. The exposed capillary leads should be routed under the booster cover and fastened to the stud in the upper right side of the booster can with the clip and nut. See Figure 43 Electric Booster in Replacement Parts section.

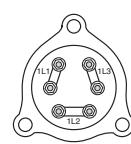

#### Configuration A

Booster tank element

## ELECTRICAL SERVICE (CONT')

### Electric Booster Heater- Element Installation

Champion built-in boosters are constructed of stainless steel and have locations for three electric booster heater elements. There are three booster configurations for the rack conveyor models:

- 40°F/22°C rise booster (minimum of 140°F/60°C incoming water)
- 60°F/34°C rise booster (minimum of 120°F/49°C to 140°F/60° incoming water)
- 70°F/39°C rise booster (minimum of 110°F/43°C incoming water)

The canisters and total Kw ratings of the booster assemblies are determined by the model number of the machine and the minimum temperature of the incoming water supply that the end user is able to supply to the machine. Machines can be supplied with 40°F/22°C rise booster or 60°F/34°C rise booster which use only one canister (nested boosted) with separate electrical connections. The 70°F/39°C rise models use two canisters in the booster assemblies, these also have separate electrical connections.

Water Saver (44 WS and 66 WS PW) models are supplied in only 40°F/22°C or 70°F/39°C rise booster assemblies. These are single canister units in either option and are not separate electrical connections.

## ELECTRICAL SERVICE (CONT')

### Motors-Pump

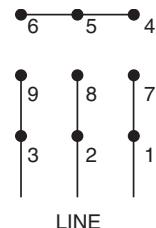

Voltage: Standard motors are multi-voltage  
 Low voltage: 208-230VAC  
 High voltage: 460VAC or 575VAC

Phase: Motors may be single or three phase.

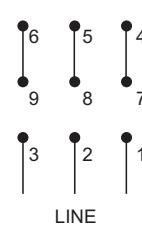

#### Wiring Connections

Refer to the diagrams below for three phase motor lead wiring.

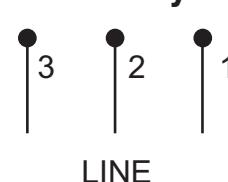

#### Low voltage 208-230V/3PH

#### High voltage 460V/3PH

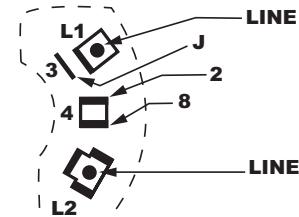

#### 575V/3PH Only

Refer to diagram at right for single phase motor lead wiring.

#### Low voltage 208-230V/1PH Only

### Troubleshooting

#### Motor will not run

1. Check incoming power to control cabinet.
2. Check for tripped manual motor starter (overload) in control cabinet.  
 (Refer to Motor Overload service section for proper settings).
3. Check power at motor contactor.

#### Motor runs hot and trips motor starter overload

1. Check for proper voltage between L1-L2 or (L1-L2, L2-L3, L1-L3 for 3 phase).
2. Check FLA on motor leads L1, L2, (also L3 for 3 phase) using amp tester.  
 (Motor full load amp (FLA) ratings are stamped on motor nameplate).

#### Motor Replacement

1. Disconnect the power to the machine.
2. Disconnect the wires to the motor junction box.
3. **Make note of the motor connections in order to phase the replacement correctly.**
4. Install the new motor and check for proper rotation.  
 (Proper rotation is clockwise looking from at the rear of the motor).
5. Motor rotation can be reversed by switching L1 and L2 on three phase motors.  
 Single phase motor rotation cannot be reversed.

## ELECTRICAL SERVICE (CONT')

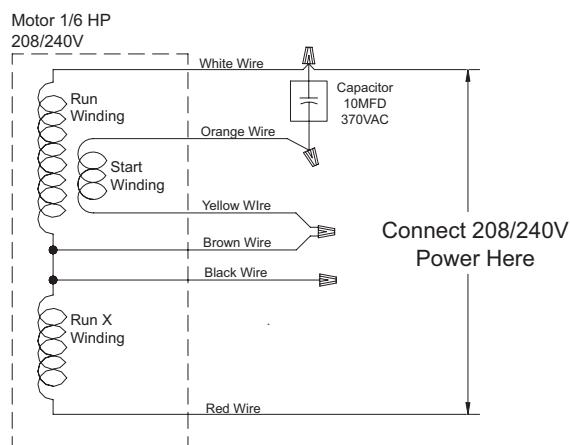

### Motors-Drive

Voltage: Standard motors are multi-voltage

Low Voltage:	208-240VAC	1 Phase Only
High Voltage:	380/480/575VAC	3 Phase Only

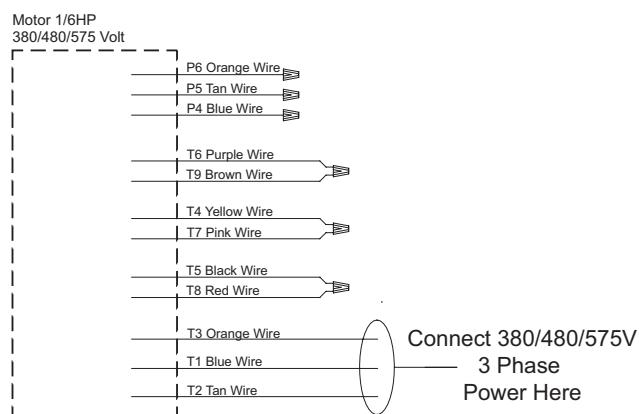

### 208-240V 1Phase Wiring Diagram

To reverse motor rotation interchange yellow and orange leads.

### 380/480/575/V 3Phase Wiring Diagram

To reverse motor rotation interchange any two external connections.

### Drive Interlock Switch

Drive interlock will activate when a jam has occurred in the unit.

- When a jam occurs, the switch opens and the pump(s) and drive motor are then shut off, similar to the reaction of pushing the red **STOP** pushbutton (the green light goes out also).
- The switch will automatically reset when the jam is cleared. To restart/reset the machine push the green **START** pushbutton and insert a loaded rack.

**Thermostat Placement**

- Select correct element numbers from chart above for specific voltage
- Limiting thermostat **113724** Should be inserted into center of element **113690** (use voltage specific element). Thermostat should bottom out in the tube approximately 12" deep. The exposed capillary leads should be routed under cover **108576** and fastened to the weld stud in the upper right side of the booster can with the clip **328048** and nut.
- Regulating thermostat **109069** should be inserted into the tube on the bottom of the booster can until it hits the opposite wall approximately 9" then pulled back 1" and fastened in place.
